Spatial Transcriptomics of the Aging Brain

Abstract

We map aging in the mouse brain with spatial transcriptomics.

Introduction

Aging changes the cellular composition of the mammalian brain.

Materials and Methods

We collected 12,000 cells from young and aged mouse brains and profiled them with spatial transcriptomics.

Libraries were sequenced on an Illumina NovaSeq 6000 instrument.

Results

Aged brains showed a 2.4-fold increase in senescent microglia.

Discussion

Senescence programs shape the aging brain microenvironment.

Limitations

Our study has several limitations: only two age groups were profiled, and the findings may not generalize to human tissue.
