Single-Cell Profiling of Drug Response

Abstract

We profile drug response in human cells with single-cell RNA sequencing.

Introduction

Drug resistance is a major clinical problem.

Materials and Methods

We treated 6,000 cells with 12 drugs and measured transcriptomes with single-cell RNA sequencing.

Libraries were sequenced on an Illumina NovaSeq 6000 instrument.

Results

Drug treatment shifted cell states toward distinct resistance programs.

Discussion

The response programs suggest new combination targets.

Limitations

Only one cell line and one time point were profiled, so the results may not generalize.
