Single-Cell Atlas of Perturbation Responses

Abstract

We profile perturbation responses in human cells.

Methods

We applied a CRISPR screen to 5,000 genes in human cells and measured transcriptomes with single-cell RNA sequencing.

Results

The screen recovered known regulators and nominated 42 new candidates.

Discussion

The results provide a resource for perturbation prediction.

Limitations

A key limitation is the use of a single cell line, which limits generalization to primary cells.
